

NEW Look JMS welcomed at W6

The W6 Show at the NEC, Birmingham saw the launch of JMS-Screens and proved a great success for Joinerysoft with over 200 demos taking place over the four day show. Joiners were quick to welcome the new look Joinery Software and took advantage of show promotions to purchase the software on the stand. Feedback from existing customers was also good, pleased with the technical support and new features being added to an already good product.

Developers within Joinerysoft have been hard at work over the last few months, putting a new vision into reality. Design

improvements to JMS further improve the

joinery software providing additional features as well as enhancing how easy it is to use. You don't

need computer knowledge to use it,

merely joinery knowledge. Design improvements recommended by customers have also

been included ensuring that

customers get exactly what they want. The new look JMS now includes:

Customer Database, with job tracking.

Duplicating customer details is now a thing of the past. Estimates, quotes and jobs are stored in directories for each customer, allowing you to quickly and easily pull up past estimates or jobs and also add new ones for existing customers.

Quick Menu.

Requested by customers, we've listened to your feedback. Changes for bespoke joinery have been refined to make our software even more user friendly and easy to use. Front end clicking on house styles within the customer database allows bespoke

NEW Look JMS welcomed at W6

changes to be selected easily.

Additional features. Front end clicking on item diagrams allows bespoke changes instantly. For example, want to change the transom? Double click on the transom and relevant options appear instantly. Point and Click and the changes are done!

Screens. All template driven to make it easier, double clicking, makes it easier still! Any door or window can be added by pointing and clicking. Complete control of items is retained with a powerful internal database, facilitating detailed bespoke changes. Easy to use choices gain access to

the powerful database simply by pointing and clicking on items. For example, need to align transoms or glazing bars in door and winglights? Simply point and click to highlight bars to be aligned. Right click and point to menu option 'align'. It couldn't be simpler.

Dave Turner, Development Director, stresses that the Joinerysoft Development Team have been working hard on these changes. "The ease of use of JMS and the exciting introduction of the customer database, is in reality the tip of the iceberg. Work underneath the simplistic front end diagrams has been

extensive, however the results are spectacular and from feedback we've received all ready, worth the time investment."

"Customers have been requesting these changes to further improve JMS. The feedback we get from customers is – We love it. Our philosophy to constantly listen to customers and welcome feedback, means that our software is second to none at providing what joiners need for bespoke joinery. The beauty of our responsive approach also means that it can only get better and better!" says, Alan

Turner from Joinerysoft.

Mick Fitzgerald of K.F.A. Sound opted for the trial version of JMS three months ago. He was so impressed with the new look JMS, demonstrated at W6 that he immediately at the stand agreed to purchase the full system including Screens. Mick comments, "The new enhanced JMS is even easier to use, with additional features adding benefit to my business. I will definitely be purchasing the complete system."
